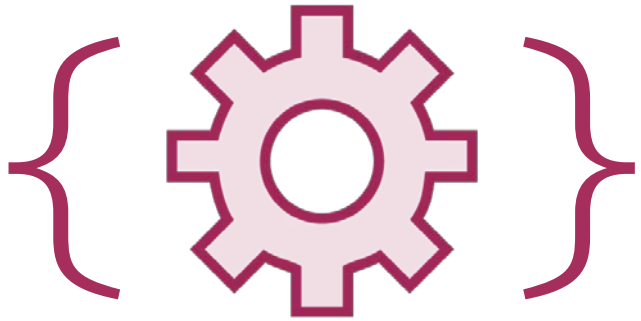
Overview

Services

Dependency Injection

Component Lifecycle Hooks



Services

Services

A Service provides anything our application needs.
It often shares data or functions between other Angular features

Services

Angular 1	Angular 2
Factories	
Services	
Providers	Class
Constants	
Values	

vehicle.service.ts

```
@Injectable()
export class VehicleService {
  getVehicles() {
    return [
      new Vehicle(10, 'Millenium Falcon'),
      new Vehicle(12, 'X-Wing Fighter'),
      new Vehicle(14, 'TIE Fighter')
    ];
  }
}
```

A Service is just a class

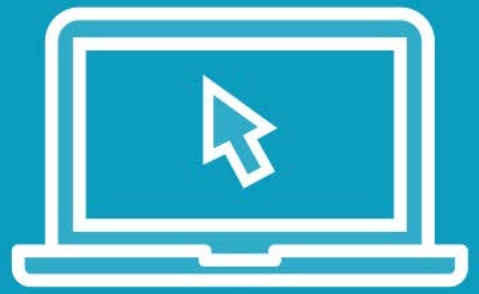
Service

Provides something of value

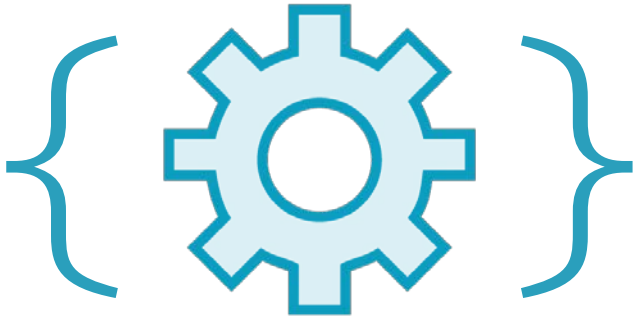
Shared data or logic

e.g. Data, logger, exception handler, or message service

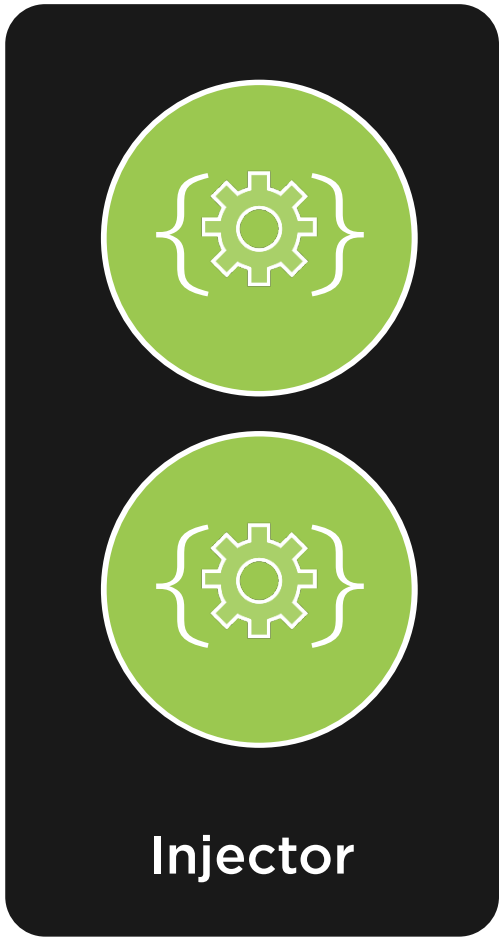
Demo



Services



Dependency Injection



Dependency Injection

Dependency Injection is how we provide an instance of a class to another Angular feature

vehicle.component.ts

```
export class VehicleListComponent {
  vehicles: Vehicle[];

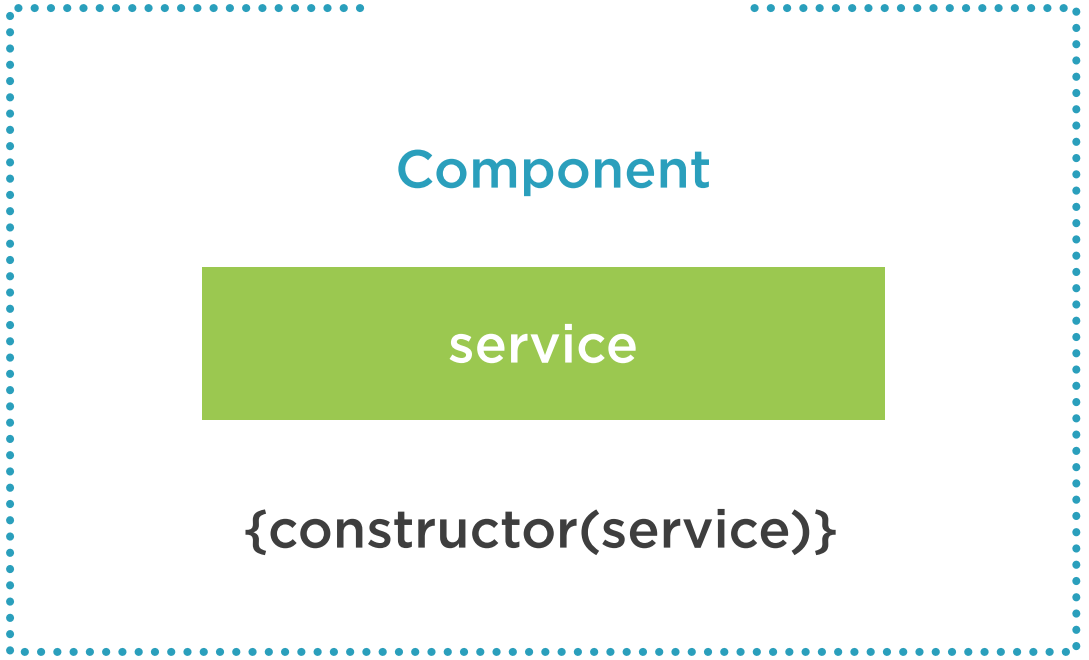
  constructor(private _vehicleService: VehicleService) {
    this._vehicleService.getVehicles()
      .subscribe(vehicles => this.vehicles = vehicles);
  }
}
```

Injecting VehicleService

Injecting a Service into a Component

Locates the service in the Angular injector

Injects into the constructor



Service is injected into the Component's constructor

Dependency Injection Then and Now

Angular 1

```
angular
  .module('app')
  .controller('VehiclesController', VehiclesController);

VehiclesController.$inject = ['VehicleService'];
function VehiclesController(VehicleService) {
  var vm = this;
  vm.title = 'Services';
  vm.vehicles = VehicleService.getVehicles();
}
```

Angular 2

```
import { VehicleService } from './vehicle.service';

@Component({
  selector: 'my-vehicles',
  templateUrl: 'app/vehicles.component.html',
  providers: [VehicleService]
})
export class VehiclesComponent {
  constructor(
    private _vehicleService: VehicleService) { }
  vehicles = this._vehicleService.getVehicles();
}
```

vehicle.service.ts

```
@Injectable()
export class VehicleService {
  constructor(private _http: Http) { }

  getVehicles() {
    return this._http.get(vehiclesUrl)
      .map((response: Response) => <Vehicle[]>response.json().data);
  }
}
```

Provides metadata about the Injectables

Injecting http

Injecting a Service into a Service

Same concept as injecting into a Component

@Injectable() is similar to Angular 1's $inject

Registering Services with the Injector

Angular 1

```
angular
  .module('app')
  .service('VehicleService', VehicleService);

function VehicleService() {
  this.getVehicles = function () {
    return [
      { id: 1, name: 'X-Wing Fighter' },
      { id: 2, name: 'Tie Fighter' },
      { id: 3, name: 'Y-Wing Fighter' }
    ];
  }
}
```

Angular 2

```
import { VehicleService } from './vehicle.service';

@Component({
  selector: 'my-vehicles',
  templateUrl: 'app/vehicles.component.html',
  providers: [VehicleService]
})
export class VehiclesComponent {
  constructor(
    private _vehicleService: VehicleService) { }
  vehicles = this._vehicleService.getVehicles();
}
```

Providers

Register these Services with Angular's injector

Injection

Inject a Service into another object

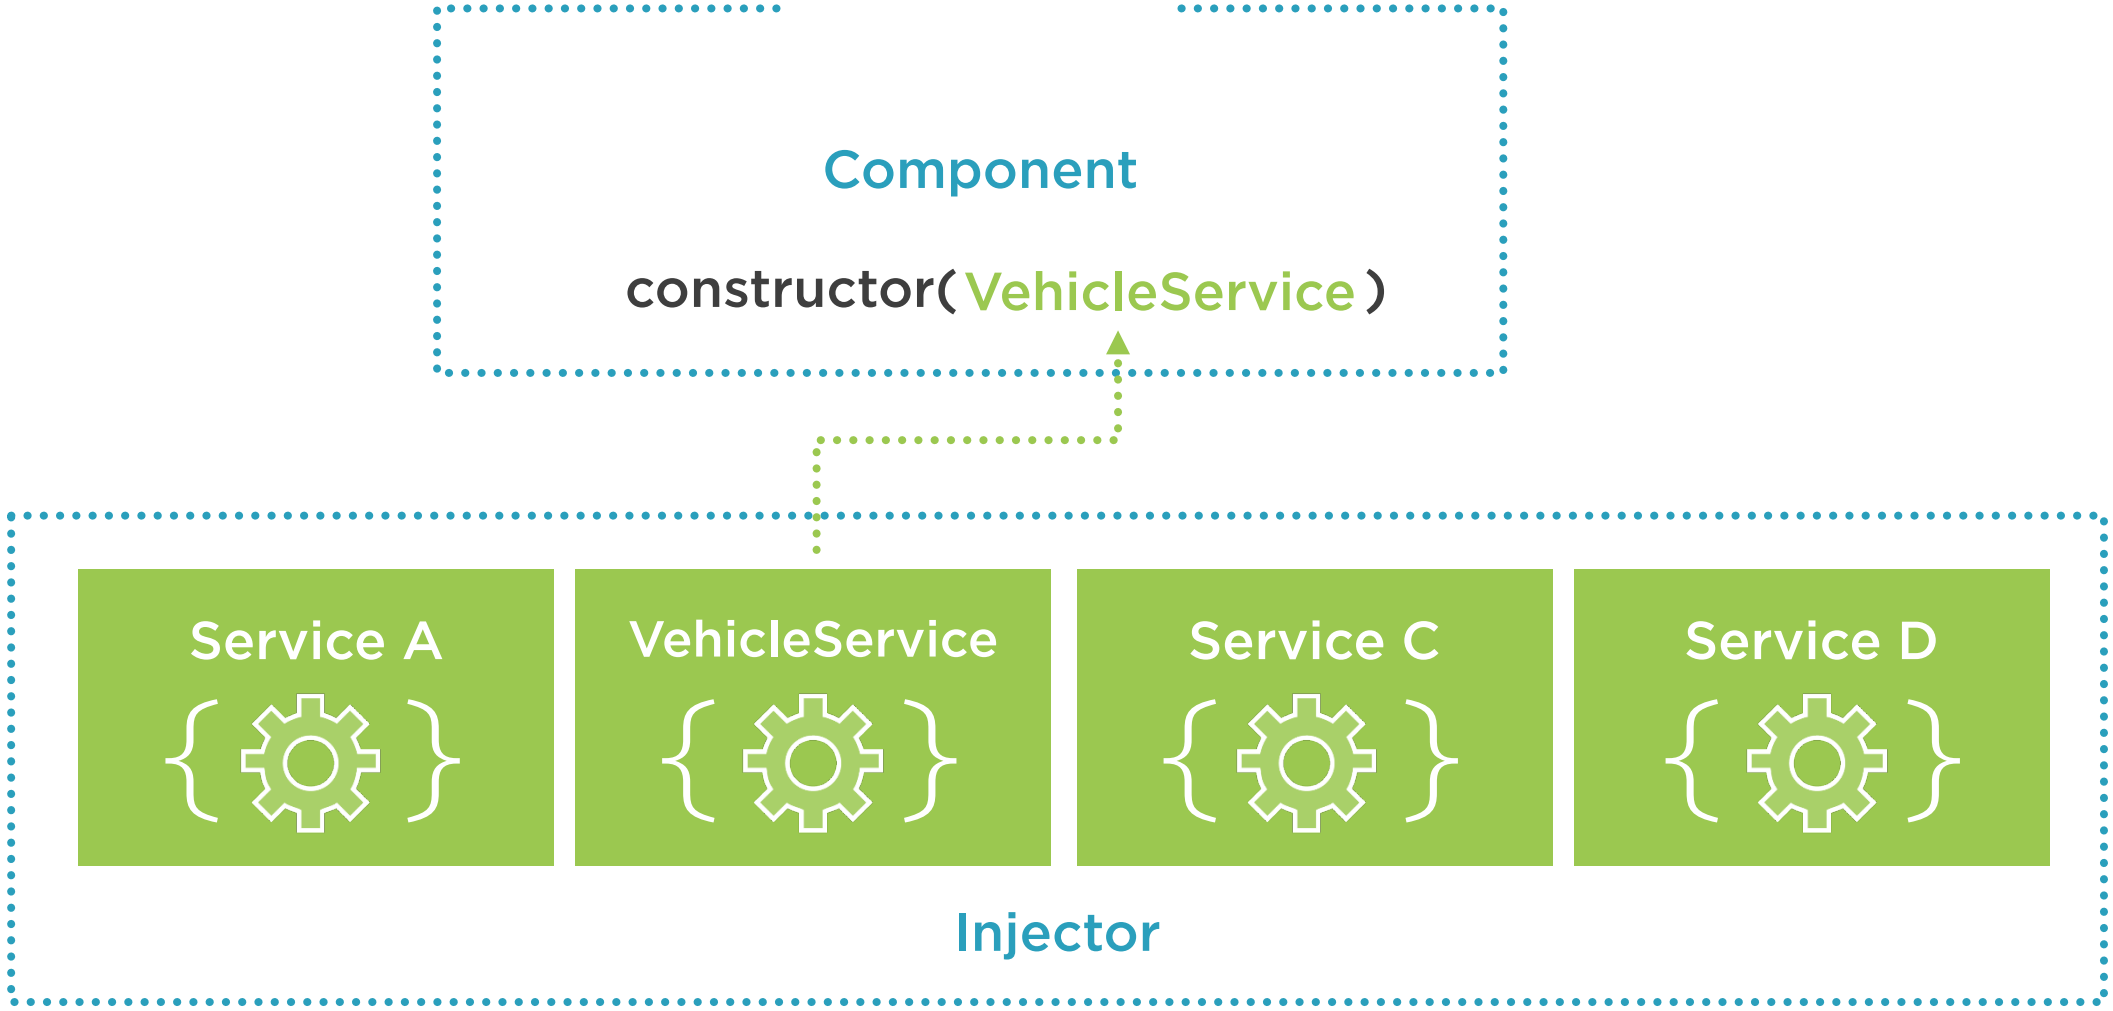
```
@Component({
  selector: 'story-characters',
  templateUrl: './app/characters.component.html',
  styleUrls: ['./app/characters.component.css'],
  directives: [CharacterDetailComponent],
  providers: [HTTP_PROVIDERS, CharacterService]
})
export class CharactersComponent implements OnInit {
  @Output() changed = new EventEmitter<Character>();
  @Input() storyId: number;
  characters: Observable<Character[]>;
  selectedCharacter: Character;

  constructor(private _characterService: CharacterService) { }

  ngOnInit() {
    this.characters = this._characterService
      .getCharacters(this.storyId);
  }

  select(selectedCharacter: Character) {
    this.selectedCharacter = selectedCharacter;
    this.changed.emit(selectedCharacter);
  }
}
```

Register the service with the injector at the parent that contains all components that require the service



Component
constructor(VehicleService)
Service A
VehicleService
Service C
Service D
Injector

Component Lifecycle Hooks

Component Lifecycle Hooks

Lifecycle Hooks allow us to tap into specific moments in the application lifecycle to perform logic.

Interface

Implement the lifecycle hook's interface

Lifecycle Hooks

When the Component initializes, the ngOnInit function is executed

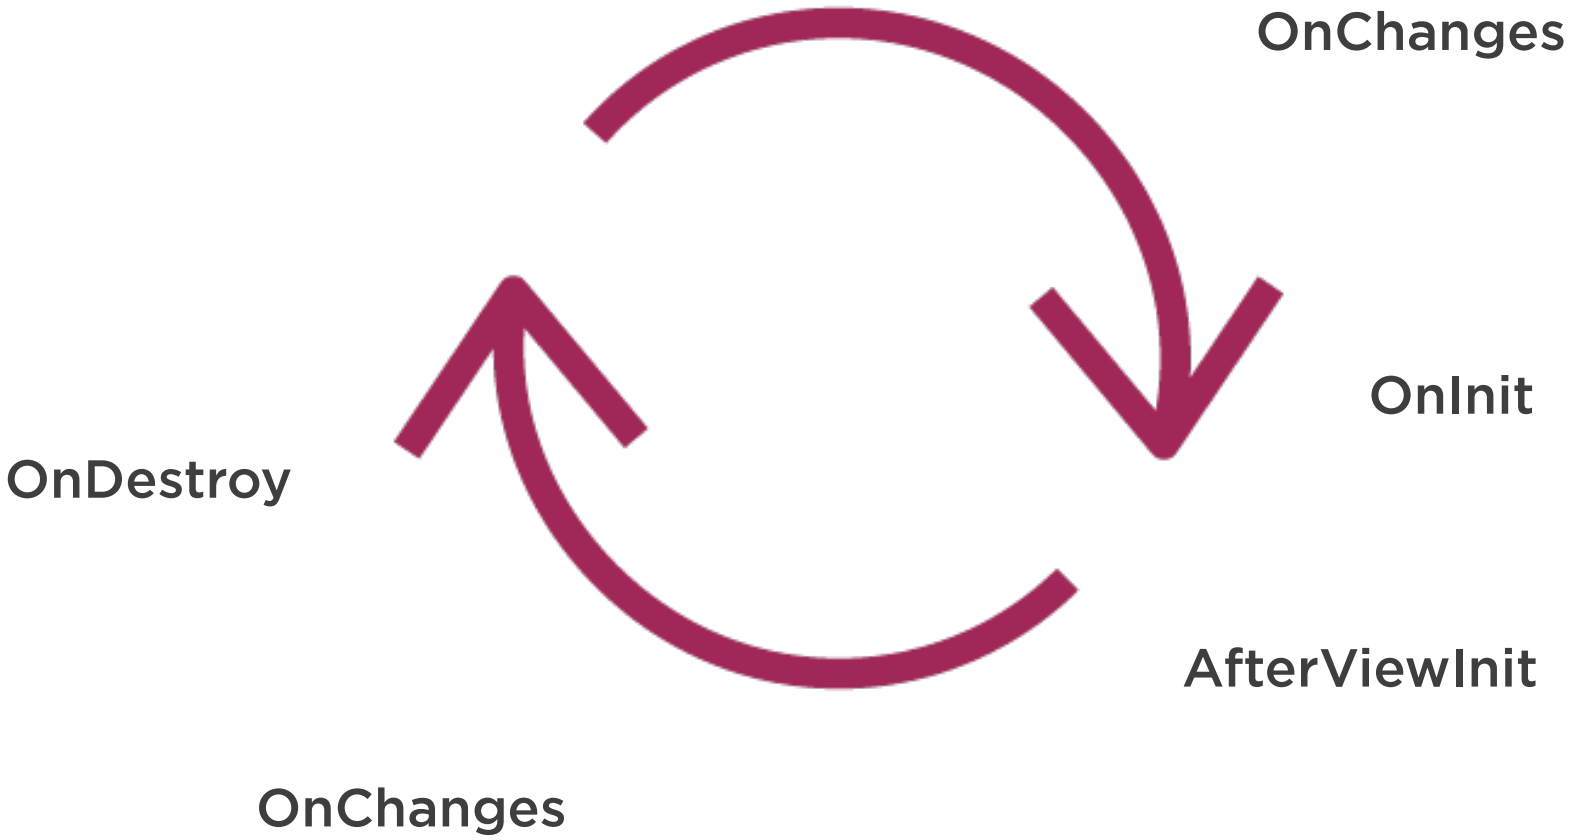
```
@Component({
  selector: 'story-characters',
  templateUrl: './app/characters.component.html',
  styleUrls: ['./app/characters.component.css'],
  directives: [CharacterDetailComponent],
  providers: [HTTP_PROVIDERS, CharacterService]
})
export class CharactersComponent implements OnInit {
  @Output() changed = new EventEmitter<Character>();
  @Input() storyId: number;
  characters: Observable<Character[]>;
  selectedCharacter: Character;

  constructor(private _characterService: CharacterService) { }

  ngOnInit() {
    this.characters = this._characterService
      .getCharacters(this.storyId);
  }

  select(selectedCharacter: Character) {
    this.selectedCharacter = selectedCharacter;
    this.changed.emit(selectedCharacter);
  }
}
```

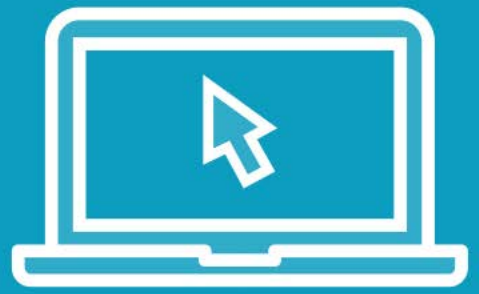
Component Lifecycle Hooks



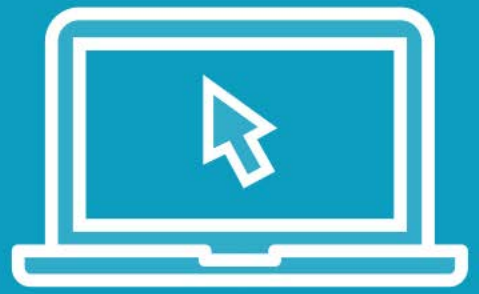
The Lifecycle Interface helps enforce the valid use of a hook

Component Lifecycle Hooks

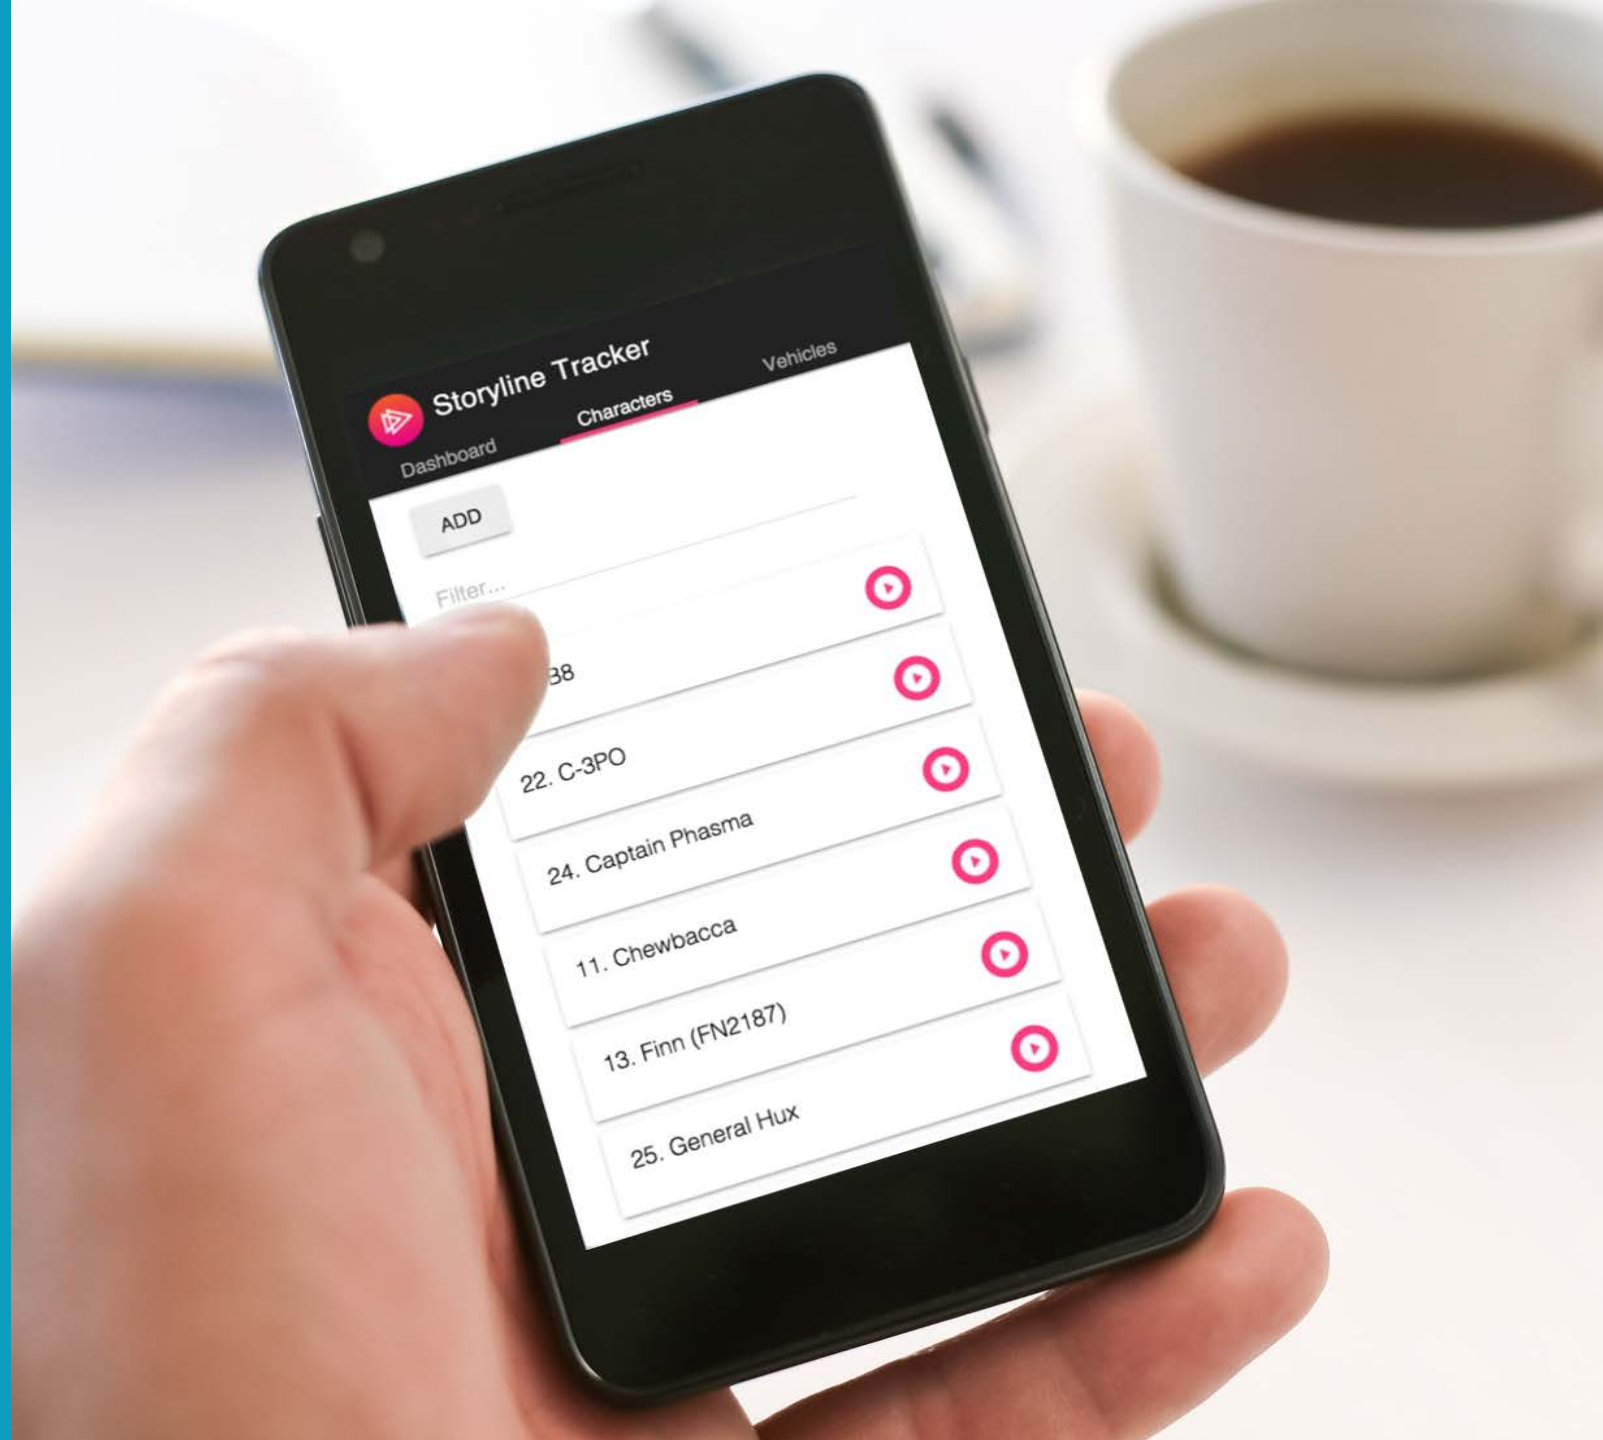
Demo



Demo



Putting It All Together



Services, DI, and LifeCycle Hooks

- Separation with Services
- Sharing Instances
- Registering with the Injector
- Constructor Injection
- Tapping into the Component's LifeCycle
